[url= TxtToSql now[/url] inboxx v.5.2.0 Inboxx is an easy to use email client that combines rich features with a comfortable user interface. The main reason why so many users swear by this program is because it is designed to deliver all the features that its users might require, while still providing a clean and organized user interface. An easy-to-use wizard There is a preview function that allows users to preview emails, as well as an option to import messages from other services. Sending and receiving new messages can also be enabled and the interface will provide all the details needed. The main window shows a list of emails along with a preview of the email text. One can see the time of the last received message, the email address, and the subject line. In the middle of the window, there is also a drop down list that displays options for different functions, such as forwarding, copying, downloading, and printing. Clean user interface and features The program will offer options for managing multiple folders, while offering all the features that its users might require. The software will allow users to manage multiple accounts and to send and receive new messages. Another feature is the possibility to import a message from POP3 and IMAP accounts, and it also offers additional options for managing accounts. Since the program can import messages directly, it can speed up the email retrieval process considerably. SOS Mail v.2.1.9.8 SOS Mail is a program that will provide users with a powerful email client that can be used on several platforms. The application is designed for Windows XP/Vista/7 and Mac OS X, although users can opt to install it on other operating systems as well. The program supports both OS X and Windows for compatibility reasons, and it also features a friendly interface, powerful search features, and a calendar function. This script is a fast and reliable method of copying files between two servers. The tool provides in-

line encryption that is fully compatible with both the McAfee CyberFast platform and the McAfee Encryptor Shield antivirus software. The McAfee Encryptor Shield integration is only available with this version. The Internet contains a wide variety of information, for which an Internet search engine may be used to search for some desired pieces of information. Typically, a user instructs the Internet search engine what terms or keywords to search for, and the search engine then retrieves a list of search results based on the keywords input. However, if the user is not familiar with the terminology of the field or subject, or is in a situation where a small amount of information is required in a hurry, an Internet search engine may not be very useful. This situation is not helped by the fact that most Internet search engines are designed to be used by people who are familiar with their fields and would normally have a good idea of what questions to ask in the first place. It would be advantageous to provide a method and apparatus that allows a user to search for information without needing to be aware of the terminology of the field or subject, and to do so in a manner that minimizes the amount of time spent on information gathering.

SUMMARY The present invention is an electronic article search engine that searches for and delivers information regarding various objects. The search engine provides a user interface through which a user can enter information regarding a desired object, such as a book, and the search engine will automatically search for the object on the Internet, and present the information to the user. A search query is formed by entering search terms into an input field on the search engine user interface. The search engine examines the search terms entered by the user to determine a search space, the collection of objects the search engine is searching for and will present to the user. The search space is formed from the search terms entered by the user, and from the objects the user may have previously marked as favorites or bookmarked. The search space is then examined for objects that contain the search terms entered by the user, and the objects that are found are returned to the user. The search engine contains a database that stores information regarding objects the user may be interested in. Typically, the objects that may be searched are books, magazines, and newspapers. The database stores information regarding each object, including the author, title, publication date, publisher, etc. The database also stores information regarding the search terms associated with each object, such as the phrase "New York Times bestseller". When the search query is entered, the database is searched to find objects that contain the search terms entered by the user. The search engine may compare the search terms entered by the user with the search terms associated with the objects to determine which objects are more likely to be of interest to the user. The search engine
